Animal and Meat Production in Ghana-An Overview
Original Article, C1
Adzitey F.

J. World's Poult. Res. 3(1):

ABSTRACT: Animal production is an integral part of Ghana's agricultural economy and a major source of livelihood for many rural dwellers. The published data is vital for the stakeholders, which include governments, extension officers, and other stakeholders will use this data in planning and making of policies, and to monitor changes that may occur overtime.

Key words: Agricultural economy, Animal production, Animal species, Meat production, Ghana.

Conventional and molecular detection of Newcastle disease and infectious Bursal disease in chickens

Original Article, C2
Majed H.M., Zahid A.A.H., Kadhim L.I., and Hasoon M.F.

J. World's Poult. Res. 3(1):

ABSTRACT: The present study was undertaken to compare different diagnostic procedures for the detection of Newcastle disease and infectious Bursal disease in chickens. The study aimed to develop more reliable, sensitive, specific and more accurate methods to detect the viruses for the confirmatory diagnosis of diseases.

Key words: Clinical diagnosis, NDV, IBDV, HI, AGIDT, RT-PCR assay.
Effect of substituting yellow maize for sorghum on broiler performance

Original Article, C3
Ahmed M.A., Dousa B.M. and Abdel Atti Kh.A.
J. World's Poult. Res. 3(1):

ABSTRACT: An experiment was conducted to study the nutritional value of yellow maize when it substitutes sorghum grain as source of energy. A total of 120 broiler chickens were divided into three equal groups of 40 birds each, and fed diets containing 0%, 25%, and 50% yellow maize, respectively. The diets were prepared as mash feed, and lasted for 6 weeks. Feed intake and body weight gain had been recorded weekly. The results showed significant increase (P < 0.05) in feed intake, body weight gain, feed conversion ratio, and carcass weight in birds fed 25% yellow maize diet compared to the control. Rural poultry farming with improved breed of backyard chicken
ABSTRACT: Livestock and poultry rearing is an imperative factor for improving the nutritional security of rural poor in India. Rural farmers rear Desi type chicken with low egg and meat production in backyard system. For developing the rural poultry farming, improved performance of the breeds and high market worth of the bird are required. Therefore, Gramapriya, Vanaraja and Backyard Chicken were selected as they are the best adapted birds for the respective environments of the area. The study reveals that the rural villagers reared these poultry species in such a way that they were capable of not only sustaining their livelihood but also providing food security. Thus, these methods can act as a solution to food security to the needy villagers paving a way for sustainable agriculture in rural areas of India.

Keywords: Backyard Chicken, Gramapriya, Rural, Vanaraja

A study on Cestode Parasites of Corvus Species of Kashmir, India

Original Article, C6
Ahmad Dar J., Tanveer S., Ahmad Kuchai J. and Ahmad Dar Sh.
J. World's Poult. Res. 3(1): 28-34
ABSTRACT: During the present study, three species of the genus *Corvus* namely *Corvus monedula*, *C. splendens* and *C. macrorhynchos* were collected from different localities of Kashmir valley and investigated for the presence of cestode parasites. *Anomotaenia galbulae* (Gmelin, 1790) Furhrmann, 1932 was recovered from all the three host species. While, *Choanotaenia micracantha* was recovered only from *C. monedula* and no specimen of this cestode was obtained from *C. Splendens* and *C. macrorhynchos* during the present study. The specimens thus collected were identified as *Anomotaenia galbulae* and *Choanotaenia micracantha* on the basis of various morphological and morphometric characters when compared to the known species of genera *Anamotaenia* and *Choanotaenia* respectively. However, some intraspecific variations were observed.

Key words: Cestode, Crows,

ABSTRACT: Regarding the remarkable role of bursa of Fabricius as a primary lymphoid organ in poultry, this study aimed to evaluate the effect of long term administration of *Zataria multiflora* as an herbal immunomodulatory agent on histological features of this organ in broiler chickens. To this end, fifty, one-day old chickens were randomly divided into five equal groups and fed with diets contained 0.5, 1, 1.5, and 2% of *Z. multiflora* (experimental groups) or basal diet (control group) for 45 days. On day 46, birds were slaughtered and bursa of Fabricius was removed and washed with physiological saline and immersed in 10% formalin and 80% ethanol. Histological sections were prepared using a microtome. For light microscopy, sections stained with hematoxylin and eosin (H&E) were used. In every section, thickness of follicular cortex, number of follicles and plicae were measured using a linear graticule. The results showed a dose dependent increase in all histomorphometric parameters due to *Z. multiflora* administration and the highest increase was in the thickness of follicular cortex of birds treated with 2% *Z. multiflora*.

In conclusion, dietary inclusion of *Z. multiflora* during the rearing period of broilers, dose dependently affects histological structures of bursa of Fabricius in a way that may enhance its role as a lymphoid organ.
